(54) Title: **PROSTAGLANDIN ENDOPEROXIDE H SYNTHASE BIOSYNTHESIS INHIBITORS**

(57) Abstract

The present invention describes pyridazinone compounds of formula (I) which are cyclooxygenase (COX) inhibitors, and in particular, are selective inhibitors of cyclooxygenase-2 (COX-2). COX-2 is the inducible isoform associated with inflammation, as opposed to the constitutive isoform, cyclooxygenase-1 (COX-1) which is an important "housekeeping" enzyme in many tissues, including the gastrointestinal (GI) tract and the kidneys. The selectivity of these compounds for COX-2 minimizes the unwanted GI and renal side-effects seen with currently marketed non-steroidal anti-inflammatory drugs (NSAIDs).

TECHNICAL FIELD

The present invention encompasses novel pyridazinone compounds useful in the treatment of cyclooxygenase-2 mediated diseases. More particularly, this invention concerns a method of inhibiting prostaglandin biosynthesis, particularly the induced prostaglandin endoperoxide H synthase (PGHS-2, cyclooxygenase-2, COX-2) protein.

BACKGROUND OF THE INVENTION

The prostaglandins are extremely potent substances which produce a wide variety of biological effects, often in the nanomolar to picomolar concentration range. The discovery of two forms of prostaglandin endoperoxide H synthase, isoenzymes PGHS-1 and PGHS-2, that catalyze the oxidation of arachidonic acid leading to prostaglandin biosynthesis has resulted in renewed research to delineate the role of these two isozymes in physiology and pathophysiology. These isozymes have been shown to have different gene regulation and represent distinctly different prostaglandin biosynthesis pathways. The PGHS-1 pathway is expressed constitutively in most cell types. It responds to produce prostaglandins that regulate acute events in vascular homeostasis and also has a role in maintaining normal stomach and renal function. The PGHS-2 pathway involves an induction mechanism which has been linked to inflammation, mitogenesis and ovulation phenomena.

Prostaglandin inhibitors provide therapy for pain, fever, and inflammation, and are useful therapies, for example in the treatment of rheumatoid arthritis and osteoarthritis. The non-steroidal anti-inflammatory drugs (NSAIDs) such as ibuprofen, naproxen and fenamates inhibit both isozymes. Inhibition of the constitutive enzyme PGHS-1 results in
5 gastrointestinal side effects including ulcers and bleeding and incidence of renal problems with chronic therapy. Inhibitors of the induced isozyme PGHS-2 may provide anti-inflammatory activity without the side effects of PGHS-1 inhibitors.

The problem of side-effects associated with NSAID administration has never completely been solved in the past. Enteric coated tablets and co-administration with
10 misoprostol, a prostaglandin derivative, have been tried in an attempt to minimize stomach toxicity. It would be advantageous to provide compounds which are selective inhibitors of the induced isozyme PGHS-2.

The present invention discloses novel compounds which are selective inhibitors of PGHS-2.

The term
10 "prodrug" refers to compounds that are rapidly transformed in vivo to provide the parent compound having the above formula, for example by hydrolysis in blood. A thorough discussion is provided in T. Higuchi and V. Stella, Pro-drugs as Novel Delivery Systems, Vol. 14 of the A.C.S. Symposium Series, and in Edward B. Roche, ed., Bioreversible Carriers in Drug Design, American Pharmaceutical Association and Pergamon Press,
15 1987, both of which are incorporated herein by reference.

As used throughout this specification and the appended claims, the term metabolically cleavable group denotes a moiety which is readily cleaved in vivo from the compound bearing it, wherein said compound, after cleavage remains or becomes pharmacologically active. Metabolically cleavable groups form a class of groups reactive
20 with the carboxyl group of the compounds of this invention are well known to practitioners of the art. They include, but are not limited to groups such as, for example, alkylcarbonyl, such as acetyl, propionyl, butyryl, and the like; unsubstituted and substituted arylcarbonyl, such as benzoyl and substituted benzoyl; alkoxycarbonyl, such as ethoxycarbonyl; trialkylsilyl, such as trimethyl- and triethysilyl; monoesters formed with
25 dicarboxylic acids, such as succinyl, and the like. Because of the ease with which the metabolically cleavable groups of the compounds of this invention are cleaved in vivo, the compounds bearing such groups act as pro-drugs of other prostaglandin biosynthesis inhibitors. The compounds bearing the metabolically cleavable groups have the advantage that they may exhibit improved bioavailability as a result of enhanced solubility and/or

rate of absorption conferred upon the parent compound by virtue of the presence of the metabolically cleavable group.

Asymmetric centers may exist in the compounds of the present invention. The present invention contemplates the various stereoisomers and mixtures thereof. Individual stereoisomers of compounds of the present invention are made by synthesis from starting materials containing the chiral centers or by preparation of mixtures of enantiomeric products followed by separation as, for example, by conversion to a mixture of diastereomers followed by separation by recrystallization or chromatographic techniques, or by direct separation of the optical enantiomers on chiral chromatographic columns. Starting compounds of particular stereochemistry are either commercially available or are made by the methods detailed below and resolved by techniques well known in the organic chemical arts.

The present invention discloses pyridazinone compounds which are cyclooxygenase (COX) inhibitors and are selective inhibitors of cyclooxygenase-2 (COX-2). COX-2 is the inducible isoform associated with inflammation, as opposed to the constitutive isoform, cyclooxygenase-1 (COX-1) which is an important "housekeeping" enzyme in many tissues, including the gastrointestinal (GI) tract and the kidneys.

Preferred compounds of the present invention include, but are not limited to, 2-Benzyl-4-(4-fluorophenyl)-5-[4-(methylthio)phenyl]-3(2H)-pyridazinone; 2-Benzyl-4-(4-fluorophenyl)-5-[4-(methylsulfonyl)phenyl]-3(2H)-pyridazinone; 2-Benzyl-4-(4-fluorophenyl)-5-methoxy-3(2H)-pyridazinone; 2-Benzyl-4-(4-fluorophenyl)-5-hydroxy-3(2H)-pyridazinone; 2-Benzyl-4-(4-fluorophenyl)-5-(trifluoromethylsulfonyloxy)-3(2H)-pyridazinone; 2-Benzyl-4-(4-fluorophenyl)-5-[4-(methylthio)phenyl]-3(2H)-pyridazinone; 2-Benzyl-4-(4-fluorophenyl)-5-[4-(methylsulfonyl)phenyl]-3(2H)-pyridazinone; 2-Phenyl-4-(4-fluorophenyl)-5-[4-(methylsulfonyl)phenyl]-3(2H)-pyridazinone; 2-(4-Fluorobenzyl)-4-(4-fluorophenyl)-5-[4-(methylsulfonyl)phenyl]-3(2H)-pyridazinone;

The compounds of the invention may be prepared by a variety of synthetic routes. Representative procedures are outlined in Schemes 1-10, below.

Scheme 1

A general route to the compounds of the invention having Formula III, where the aryl group at the 5-position on the pyridazinone ring is substituted with a sulfonyl group is described in Scheme 1. Dichloro-3(2H)-pyridazinone can be treated with benzyl chloride and potassium carbonate in methanol to provide 2-benzyl-4-chloro-5-methoxy-3(2H)-pyridazinone. 2-Benzyl-4-chloro-5-methoxy-3(2H)-pyridazinone can be treated with a boronic acid such as 4-fluorobenzeneboronic acid (shown) and a palladium catalyst and the methoxy group can be hydrolyzed with 48% hydrobromic acid to provide the 5-hydroxypyridazinone compound. The 5-hydroxypyridazinone product can be treated with triflic anhydride followed by substitution on the pyridazinone ring using 4-methylthiobenzeneboronic acid to provide the methyl thioether compound. The methyl thioether compound which can be treated with peracetic acid in acetic acid and methylene chloride to provide the methyl sulfone. The benzyl group can be removed using aluminum bromide or another suitable Lewis acid. The R group can be added using an appropriate alkylating agent and base.

Scheme 2

An alternative route to the compounds of the present invention having Formula III is described in Scheme 2. 4-Bromothioanisole or another suitable thioether can be treated with a trialkoxyborate, such as trimethoxyborate or triisopropylborate to provide 4-(methylthio)benzeneboronic acid. The boronic acid can be treated with 2-benzyl-4,5-dibromo-3(2H)-pyridazinone using tetrakis(triphenylphosphine)palladium (0) in

dimethoxyethane and then coupled with a second boronic acid such as 4-fluorobenzeneboronic acid (shown) in the presence of a palladium catalyst to provide the thioether. The methyl thioether compound can be treated with meta-chloroperoxybenzoic acid (MCPBA) in methylene chloride to provide the methyl sulfone.

5

Scheme 3

15

An alternative route to the compounds of the present invention having Formula III

is described in Scheme 3. (4-Thiomethylphenyl)dimethylthioacetone acetal, mono-S-oxide can be prepared by reaction of 4-thiomethylbenzaldehyde (Y is CH₂S) with methyl(methylsulfinylmethyl)sulfide and sodium hydroxide. The thioacetone acetal and methyl 4-fluorophenylacetate or suitable ester (X is fluorine) can be treated with a strong base such as sodium hexamethyldisilazide in THF to provide the butyrate ester. The dithioacetone ketene can be directly cyclized to the N-unsubstituted pyridazinone using hydrazine and a salt. The pyridazinone can be then be alkylated using an appropriate alkylating agent and a base.

Scheme 4

In an alternate route, shown in Scheme 4, the thioacetal ketene ($X=F$ and $Y=CH_3S$) can be treated with perchloric acid to provide an ester-aldehyde as a mixture of diastereomers. The oxidation products can be treated with hydrazine and then oxidized with peroxyacetic acid to provide the sulfonyl dihydropyridazinone ($Y=CH_3SO_2$). The dihydropyridazinone can be dehydrogenated to form the pyridazinone by treatment with reagents such as bromine in acetic acid. The R group may be added via substitution using an appropriate alkylating agent and base.

Scheme 5

The preparation of the 5-hydroxy-2(5H)-furanones can be accomplished by the application of methodologies published in a variety of sources, including: J. Med. Chem., 1987, 30, 239-249 and WO 96/36623, hereby completely incorporated by reference. These 5-hydroxy-2(5H)-furanones can be converted to 6-substituted-4,5-diaryl-3(2H)pyridazinones as described in Scheme 5.

Scheme 6

A general route to the compounds of the invention having Formula III, where the aryl group at the 5-position on the pyridazinone ring is substituted with a para-sulfonyl group is described in Scheme 6. A mucohalo acid, such as mucobromic or mucochloric acid, can be treated with an hydrazine having the desired R group to provide the dihalopyridazinone compound, 6A. The dihalo-compound can be treated with an alcohol

in the presence of a base, such as sodium or potassium hydride, to provide an alkoxide 6B where R^{97} is selected from alkyl, aryl, arylalkyl, heterocyclic, and heterocyclic alkyl. (If the alkoxy group is to be removed at a later time then methanol is the preferred alcohol.) The alkoxy-halide can be treated with methylthiophenylboronic acid to provide the alkoxy-pyridazinone 6C. The alkoxy group can be converted to a hydrocarbonyl group by treatment with a Grignard reagent to provide thioether 6D where R^{96} is alkyl. The thioether 6D can be oxidized with an oxidizing agent, such as peracetic acid, meta-chloroperoxybenzoic acid and the like, to form the sulfinyl compound 6G, or the methylsulfonyl compound 6E. The methylsulfinyl compound, 6G, can be treated with trifluoroacetic anhydride and NaOH/MeOH followed by addition of chlorine gas and then ammonia hydroxide to provide the aminosulfonyl compound, 6H. Alternatively, the methylsulfonyl compound, 6E, can be treated with a diazodicarboxylate, such as DBAD, DIAD, DEAD and the like, and a disilazane anion, such as lithium HMDS and the like, followed by treatment with sodium acetate and hydroxylamine-O-sulphonic acid in water to provide the aminosulfonyl compound, 6H.

Scheme 7

Methylsulfonyl alkoxy pyridazinones and aminosulfonyl alkoxy pyridazinones can
5 be prepared as described in Scheme 7. Alkoxy-pyridazinone, 6C, from Scheme 6, can be
oxidized using peracetic acid to provide methyl sulfone, 7A. Methyl sulfone alkoxy
pyridazinone, 7A, can be treated as described in Scheme 6 to provide aminosulfonyl
alkoxy pyridazinone, 7B. Alternatively, alkoxy-pyridazinone 6C, from Scheme 6, can be
10 oxidized with one equivalent of meta-chloroperoxybenzoic acid or one equivalent of
hydroxy(tosyloxy)iodobenzene to provide the methylsulfinyl alkoxy pyridazinone, 7C.
Methylsulfinyl alkoxy pyridazinone, 7C, can be treated as described in Scheme 6 to
provide aminosulfonyl alkoxy pyridazinone, 7B.

Scheme 8

5 Pyridazinones of general formula 8D and 8E, wherein R^{80} is hydroxyalkyl, and A and B are selected from alkenyl, alkyl, haloalkyl, and halogen, can be prepared as described in Scheme 8. Pyridazinones of general formula 8A can be treated with diols and a base such as sodium hydride or potassium hydride in THF to selectively provide 4-

10 substituted pyridazinones of general formula 8B. 4-Substituted pyridazinones of general formula 8B can be treated with 4-(methylthio)phenylboronic acid, a base such as potassium carbonate, and a palladium catalyst such as

15 dichlorobis(triphenylphosphine)palladium(II) in ethanol to provide methylthio compounds of general formula 8C. Methylthio compounds of general formula 8C can be oxidized with meta-chloroperoxybenzoic acid or peracetic acid to provide methylsulfones of general formula 8D. Methylsulfones of general formula 8D can be processed as described in Scheme 6 to provide aminosulfonyl compounds of general formula 8E. Alternatively, methylthio compounds of general formula 8C can be oxidized to the sulfoxide and then processed as described in Scheme 6 to provide aminosulfonyl compounds of general

formula 8E.

Scheme 9

Preparation of compounds of the invention having Formula III, where the group at the 4-position on the pyridazinone ring is a substituted alkyl or alkenyl group is described in Scheme 9. Pyridazinone 9A can be treated with a halogenating reagent, such as NBS and peroxide, to provide bromo compound 9B. The bromo compound can be reacted with an alcohol and a weak base, such as sodium or potassium carbonate, to provide 4-alkyl-ether, 9C where R^{95} is alkyl. Alternatively, bromo compound 9B can be treated with a thio compound in the presence of a base, such as silver carbonate, to provide 4-alkyl-thioether, 9D where R^{94} is alkyl. Alternatively, bromo compound 9B can be treated with an amine

and a weak base, such as sodium or potassium carbonate to provide 4-alkylaminoalkyl compound 9E where R⁹³ is alkyl.

Scheme 10

A general route to the compounds of the present invention having Formula III, where the group at the 4-position on the pyridazinone ring can be readily substituted is illustrated in Scheme 10. Alkoxide, 10A, where R⁹⁷ is methyl, can be treated with a base, such as sodium or potassium hydroxide, to provide 4-hydroxy-pyridazinone, 10B. The alcohol can be treated with p-toluenesulfonyl chloride to provide tosyloxy compound, 10C. The tosyloxy compound can be readily substituted with a compound R⁹²Z that can undergo a S_NAr reaction. Examples of these compounds are alcohols, thiols, amines or hydrocarbyl anions.

4-(Methylthio)benzeneboronic acid

A stirred solution of 4-bromothioanisole (5.0 g, 0.0246 mol) in anhydrous tetrahydrofuran (THF) was chilled to -78 °C under a nitrogen atmosphere. A 2.5 M solution of n-butyl lithium (12 mL, 0.030 mol) in hexanes was added dropwise to the chilled solution. When the addition was complete, the reaction mixture was stirred at -78 °C for about 45 minutes. Trimethylborate (8.5 mL, 0.0748) was introduced via syringe. The reaction mixture was lowered to about pH=4-5 using 10% aqueous citric acid and the THF was removed under reduced pressure. The aqueous residue was saturated with sodium chloride and extracted with ethyl acetate. The organic extract was dried over MgSO₄ and filtered. Magnesium turnings (500 mg) were placed in a dry 250 mL round bottom flask. Anhydrous ether (20 mL) was added under N_2 at room temperature then fluorobenzyl bromide (3 mL) was added and stirred. The reaction was heated at 40 °C for 2 hours. All magnesium was consumed resulting in a pale brownish-yellow solution. The 2-(2,2,2-trifluoroethyl)-4-chloro-5-[4-(methylsulfonyl)phenyl]-3(2H)-pyridazinone prepared in

TLC (2:1 hexanes/ethyl acetate) indicated that the pyridazinone starting material was consumed.) The reaction was cooled to room temperature then quenched with a saturated NH_4Cl solution. The product was extracted with ethyl acetate (250 mL); and the organic layer was washed with saturated NH_4Cl , and brine. The ethyl acetate solution was dried over MgSO_4 and filtered. The title compound was prepared starting with 2-benzyl-4-(4-fluorophenyl)-5-[4-(methylthio)phenyl]-3(2H)-pyridazinone and oxidizing the sulfide according to the
25 procedure in example 69B

Example 260B

Bis(4-(5-(2-benzyl-4-(4-fluorophenyl)-3(2H)-pyridazinone)phenyl)disulfide:

A heterogeneous solution of 2-benzyl-4-(4-fluorophenyl)-5-[4-(methylsulfinyl)phenyl]-3(2H)-pyridazinone (1.0 g, 2.39 mmol) in trifluoroacetic anhydride (10 mL, 70.8 mmol) was rapidly stirred at reflux for 2 hours with a bath temperature of 40-43 °C. The reaction solution was cooled to 23 °C, concentrated in vacuo, and azeotroped with toluene (2 x 5-7 mL). The resultant yellow/orange oil was cooled to 0 °C, and methanol/triethylamine (1:1, 6 mL) was slowly added, along the interior wall of the reaction vessel with rapid stirring. The bright red-orange solution was stirred for 10 minutes at 0 °C, the cooling bath removed, and the reaction mixture stirred an additional 1.5 hours warming to 23 °C. The mixture was cooled back to 0 °C, and a saturated NH₄Cl solution (200 mL) slowly added followed by enough aqueous 1 M HCl to adjust the solution to pH 1-2. The cooling bath was removed and the solution stirred overnight. The mixture was extracted with ethyl acetate. The ethyl acetate solution was washed with water and brine, and concentrated in vacuo. The resultant yellow/brown oil (0.89 g) was a mixture of predominantly the mono-sulfide and desired di-sulfide. Subsequent rapid stirring of a portion of the crude reaction mixture (360 mg) in benzene (100 mL) with I₂ (648 mg, 2.55 mmol) at 23 °C for 30 minutes completed the conversion of the mono-sulfide to the di-sulfide. (Chem. Pharm. Bull., 1992, 40, 2842) The mixture was treated with a 0.1 M Na₂S₂O₃ solution to consume the excess I₂. This solution was extracted with ethyl acetate, and the ethyl acetate layers dried over MgSO₄, filtered, and concentrated in vacuo. The residue was dissolved in CH₂Cl₂/hexanes and concentrated in vacuo to provide the of product (yield: 347 mg, 90% for partial conversion). ¹H NMR (300 MHz, CDCl₃) δ 5.38 (s, 4H), 6.91 (dd, J=8.8, 8.8 Hz, 4H), 7.02 (d, J=8.7 Hz, 4H), 7.11-7.20 (m, 4H), 7.28-7.39 (m, 10H), 7.54 (dd, J=6.9, 1.5 Hz, 4H), 7.83 (s, 2H).

Example 260C

2-Benzyl-4-(4-fluorophenyl)-5-[4-(trifluoromethylthio)phenyl]-3(2H)-pyridazinone:

A rapidly stirred mixture of bis[4-{5-[2-benzyl-4-(4-fluorophenyl)-3(2H)-pyridazinone]}-phenyl]-disulfide (140 mg, 0.181 mmol), potassium trifluoroacetate (55 mg, 0.361 mmol), and sulfolane (1.5 mL) was immersed in a 180 °C pre-heated oil bath.

The oil bath was heated to increase the temperature to 210 °C, and the reaction flask was promptly removed from the oil bath after 10 minutes from the point of first immersion. During the course of the reaction, the mixture changed from colorless and heterogeneous to deep, blood red and homogeneous. After cooling to 23 °C, the mixture was diluted with ethyl acetate and washed with aqueous 1 M HCl, water, and brine. The ethyl acetate solution was dried over MgSO₄, filtered and concentrated in vacuo. The residue was chromatographed (flash silica gel, ethyl acetate/hexanes 1:4) to provide the product (yield: 17 mg, 41%). After 1.75 hours, 3.5 hours, 5 hours, and 6 hours, the reaction was not complete and additional 3-chloroperoxybenzoic acid (380 mg, 1.3 mmol, 57-86%) was added each time. With the reaction completed after 7.75 hours, the mixture was cooled to 23 °C and concentrated in vacuo. The residue was diluted with ethyl acetate and carefully shaken with a NaHSO₃ solution, 3 times, for several minutes to consume the excess 3-chloroperoxybenzoic acid. The ethyl acetate solution was subsequently washed with a saturated Na₂CO₃ solution (3x), water, and brine and dried over MgSO₄, filtered, and concentrated in vacuo. The residue was chromatographed (flash silica gel, ethyl acetate/methylene chloride/hexanes 1:2:7) to provide of product (yield: 93 mg, 87%). (J. Med. (4-Fluorophenyl)-5-[4-(methylselenonyl)phenyl]-3(2H)-pyridazinone

Example 456A

4-Bromoselenoanisole

Freshly crushed magnesium turnings (6.1 g, 0.25 mol) were suspended with vigorous stirring in a solution of diethyl ether (360 mL) and 1,4-dibromobenzene (10 g, 0.04 mol). The solution was brought to reflux for 30 minutes, without initiation. Several crystals of iodine were added which initiated the reaction to a self-sustained reflux. The

reflux was maintained as the remainder of the 1,4-dibromobenzene (49 g, 0.21 mol) was slowly added. The reaction was refluxed for an additional 2 hours after addition of the 1,4-dibromobenzene was completed. When nearly all of the magnesium turnings had been consumed, the yellow/gray heterogeneous solution was cooled to 23 °C, and selenium (19 g, 0.24 mol) was added in small portions via spatula so as to maintain a gentle reflux. The selenium that became stuck to the sides of the flask was washed in with additional diethyl ether. After addition, the solution was stirred for 20 minutes at 23 °C and then was cooled to 0 °C. A diethyl ether (20 mL) solution of methyl iodide (35.5 g, 0.25 mol) was slowly added dropwise to the reaction mixture. Upon completion of addition, the cooling bath was removed, and the solution stirred for 3 hours at 23 °C. The reaction solution was slowly poured into ice water/1 M HCl, and then the biphasic solution filtered through a glass wool plug. The ethereal layer was separated and the aqueous phase extracted twice more with diethyl ether. The combined ethereal extracts were dried over MgSO₄, filtered, and concentrated in vacuo to provide a semi-viscous orange oil. On standing overnight at -20 °C, large yellow needles formed. The residual oil was drawn off via pipette to provide 17 g (27%) of crystalline product. (J. Org. Example 545A

Ethyl (R)-3-(tert-butyldimethylsiloxy)butanoate

To a stirred, room temperature solution of ethyl (R)-3-hydroxybutanoate (5.00 g, 37.8 mmol) and tert-butyldimethylsilyl chloride (6.85 g, 45.5 mmol) in DMF (90 mL) was added imidazole (3.87 g, 56.9 mmol). This reaction mixture was stirred at room temperature for 18 hours. The reaction mixture was partitioned between hexane (300 mL) and water (100 mL). The organic layer was washed with water (2 X 100 mL) then dried (MgSO₄) and filtered. The filtrate was concentrated under reduced pressure to give the title compound.

Example 545B

(R)-3-(tert-Butyldimethylsiloxy)-1-butanol

The crude product from Example 545A (~37 mmol) was dissolved in dichloromethane (100 mL). To this stirred solution, chilled to -78°C, was added dropwise

a 1M solution of diisobutylaluminum hydride in dichloromethane (185 mL, 185 mmol). The reaction mixture was stirred at -78°C for two hours, then it was allowed to warm to -30°C and stirred an additional 0.5 hours. Methanol was then added carefully at -20°C to quench any remaining hydride. The reaction mixture was then diluted with methyl tert-butylether (200 mL) and washed with aqueous sodium tartrate solution (4 X 100 mL) and brine (2 X 100 mL). The organic layer was dried (MgSO₄) and filtered. The filtrate was concentrated under reduced pressure to give the crude title compound (6.3 g, 83%).

Example 545C

10 (R)-2-(3,4-Difluorophenyl)-4-[3-(tert-butyl dimethylsiloxy)-1-butoxy]-5-bromo-3(2H)-pyridazinone

To a stirred, 0°C solution of the product from Example 545B (3.4 g, 10 mmol) in THF (20 mL) was added 1M sodium bis(trimethylsilyl)amide in THF (12 mL, 12 mmol). The reaction mixture was stirred at room temperature for 0.5 hours, then it was transferred to a stirred, -30°C solution of 2-(3,4-difluorophenyl)-4,5-dibromo-3(2H)-pyridazinone (3.66 g, 10 mmol) in THF (100 mL). The reaction mixture was stirred at -30°C for 1 hour, then overnight while warming to room temperature. The reaction was quenched with saturated aqueous ammonium chloride solution (100 mL) and extracted with ethyl acetate (2 X 100 mL). The organic layer was washed with brine (2 X 20 mL), then dried (MgSO₄), and filtered. The filtrate was concentrated under reduced pressure and the residue was purified by column chromatography (silica gel, 90:10 hexane/ethyl acetate) to provide the title intermediate (2.5 g, 51%).

C for 4 hours. The reaction mixture was then cooled to room temperature, water (30 mL) was added and stirring was continued for 2 hours. The crude black precipitate was collected by filtration then washed with water (10 mL) and hexane (10 mL). This title intermediate was used without further purification in the following oxidation/deprotection step.

Example 545E

(R)-2-(3,4-Difluorophenyl)-4-(3-hydroxy-1-butoxy)-5-[4-(methylsulfonyl)phenyl]-3(2H)-pyridazinone

The reaction mixture was stirred for 1 hour while warming to room temperature. At this point the oxidation was complete, but some of the product's hydroxy group was still silylated so 1M tetrabutylammonium fluoride in THF (4 mL, 4 mmol) was added and stirring was continued for 0.5 hours. The reaction mixture was then treated with 5% aqueous sodium thiosulfate solution (30 mL) for 2 hours. The precipitated product was collected by filtration, washed with water (10 mL) and hexane (10 mL). The solid was stirred in isopropanol (5 mL) for 6 hours then collected by filtration and dried to provide the title compound (0.78 g, 87%). mp 126-129 °C; ¹H NMR (300 MHz, CDCl₃) δ 1.22 (d, J = 6 Hz, 3H), 1.62-1.74 (m, 1H), 1.84-1.94 (m, 1H), 3.16 (s, 3H), 3.30 (s br, 1H), 4.00-4.10 (m, 1H), 4.20-4.30 (m, 1H), 4.63 (td, J = 9.6 Hz, J = 4 Hz, 1H), 7.25-7.34 (m, 1H), 7.46-7.52 (m, 1H), 7.56-7.64 (m, 1H), 7.78-7.84 (m, 2H), 7.97 (s, 1H), 8.06-8.12 (m, 2H); MS (DCI/NH₃) m/z 468 (M+NH₄)⁺.

Prostaglandin Inhibition Determination

Compound Preparation and Administration

For oral administration, test compounds were suspended on the day of use in 100% polyethyleneglycol (PEG 400) with a motorized homogenizer equipped with a Teflon-coated pestle (TRI-R Instrument, Jamaica, NY).

To compare the mean responses of the treatment groups, analysis of variance was applied. Percent inhibition values were determined by comparing the individual treatment mean values to the mean of the control group. Linear regression was used to estimate IC_{50} 's/ ED_{50} 's in appropriate assays.

EIA Determination of Prostaglandins

EIA reagents for prostaglandin determination were purchased from Perseptive Diagnostics, (Cambridge, MA). Prostaglandin E₂ (PGE₂) levels in lavage fluids were determined after the samples were dried under nitrogen and reconstituted with assay buffer. PGE₂ levels in enzyme assays or cell culture media were measured against standards prepared in the same milieu. The immunoassays were conducted as recommended by the manufacturer. The EIA was conducted in 96 well microtiter plates (Nunc Roskilde, Denmark) and optical density was measured using a microplate reader (Vmax, Molecular Devices Corp., Menlo Park, CA).

Recombinant Human PGHS-1 and PGHS-2 Enzyme Assays

Inhibition of prostaglandin biosynthesis in vitro was evaluated using recombinant human Cox-1 (r-hu Cox1) and Cox-2 (r-hu Cox-2) enzyme assays. Representative compounds dissolved in DMSO (3.3% v/v) were preincubated with microsomes from recombinant human PGHS-1 or PGHS-2 expressed in the baculovirus/Sf9 cell system (Gierse, J. K., Hauser, S. D., Creely, D. P., Koboldt, C., Rangwala, S., H., Isakson, P. C., and Seibert, K. Expression and selective inhibition of the constitutive and inducible forms of cyclooxygenase, Biochem J. 1995, 305: 479.), together with the cofactors phenol (2 mM) and hematin (1 µM) for 60 minutes prior to the addition of 10 µM arachidonic acid. The reaction was allowed to run for 2.5 minutes at room temperature prior to quenching with HCl and neutralization with NaOH. PGE₂ production in the presence and absence of the drug was determined by EIA analysis. The EIA was conducted in 96 well microtiter plates (Nunc Roskilde, Denmark) and optical density was measured using a microplate reader (Vmax, Molecular Devices Corp., Menlo Park, CA). EIA reagents for prostaglandin determination were purchased from Perseptive Diagnostics (Cambridge, MA). PGE₂ levels were measured against standards prepared in the same milieu. The immunoassays were conducted as recommended by the manufacturer.

The data illustrating the inhibition of prostaglandin biosynthesis in vitro by compounds of this invention is shown in Table 1. The compounds are designated by the Example Number. Column 2 shows Cox-1 percent inhibition at the particular micromolar

dose level and Column 3 shows Cox-2 percent inhibition at the particular nanomolar dose level. Values for Cox-1 and Cox-2 inhibition that are parenthetical indicate IC₅₀

IL-1 β Induced PGE₂ Production in WISH Cells

Human amnionic WISH cells were grown to 80% confluence in 48 well plates. Following removal of the growth medium and two washings with Gey's Balanced Salt Solutn, 5 ng IL-1 β /ml (UBI, Lake Placid, NY) was added to the cells with or without test compound in DMSO (0.01% v/v) in Neuman-Tytell Serumless Medium (GIBCO, Grand Island, NY). Following an 18 hour incubation to allow for the maximal induction of PGHS-2, the conditioned medium was removed and assayed for PGE₂ content by EIA analysis as described above.

Monocyte U937 (ATCC, Rockville, MD) cells were grown in a similar fashion to the WISH cells. After incubation, the conditioned medium was removed and assayed for Cox-1 content by EIA analysis as described above.

5 The data illustrating the inhibition of prostaglandin biosynthesis in vitro by compounds of this invention is shown in Table 2. U937 values indicate Cox-1 percent inhibition at the particular micromolar dose level while partenthetical values indicate IC₅₀ values. WISH cell values indicate percent inhibition at the particular micromolar dose level while parenthetical values indicate IC₅₀ values.

Human Whole Platelet Cyclooxygenase-1 Assay (HWCX)

10 Blood from normal healthy volunteers is collected into tubes containing ACD (acid citrate dextrose) as the anticoagulant. This blood is centrifuged at 175 x g to prepare platelet rich plasma. The platelet rich plasma is then centrifuged at 100 x g to pellet the white blood cells, leaving the platelets in the supernatant. The supernatant is layered on a cushion of 0.7 mL of 10% bovine serum albumin in Tyrodes solution (Gibco; Grand
15 Island, NY) and then centrifuged at 1000 x g. The resulting supernatant from this centrifugation is then removed and 11 mL of Tyrodes solution is added to the remaining pellet of platelets. The platelets are then aliquoted at 120 µl into a 96 well plate. Experimental compounds are added and allowed to pre-incubate for 10 minutes. At the
20 end of this pre-incubation period, the calcium ionophore A23187 is added to a final concentration of 8.8 µM and the incubation is continued for ten minutes. The reaction is stopped by adding cold 6 mM EDTA, the incubation mixture is centrifuged at 220 x g, and the supernatants are then analyzed for thromboxane using a commercial kit from Cayman Chemical (Ann Arbor, MI).

Carrageenan Induced Paw Edema (CPE) in Rats

Hindpaw edema was induced in male rats as described by Winter et al., Proc. Soc. Exp. Biol. Med., 1962, 111, 544. Briefly, male Sprague-Dawley rats weighing between 170 and 190 g were administered test compounds orally 1 hour prior to the subplantar injection of 0.1 ml of 1% sodium carrageenan (lambda carrageenan, Sigma Chemical Co., St Louis, MO) into the right hindpaw. Right paw volumes (ml) were measured immediately following injection of carrageenan for baseline volume measurements using a Buxco plethysmograph (Buxco Electronics, Inc., Troy, NY). Three hours after the injection of carrageenan, right paws were remeasured and paw edema calculated for each rat by subtracting the zero time reading from the 3 hour reading. Data are reported as mean percent inhibition +/- SEM. Statistical significance of results was analyzed by Dunnetts multiple comparison test where $p < 0.05$ was considered statistically significant.

Rat Carrageenan Pleural Inflammation (CIP) Model

Pleural inflammation was induced in male adrenalectomized Sprague-Dawley rats following the method of Vinegar et al., Fed. Proc. 1976, 35, 2447-2456. Animals were orally dosed with experimental compounds, 30 minutes prior to the intrapleural injection of 2% lambda carrageenan (Sigma Chemical Co., St. Louis MO). Four hours later the animals were euthanized and the pleural cavities lavaged with ice cold saline. The lavage fluid was then added to two volumes of ice cold methanol (final methanol concentration 66%) to lyse cells and precipitate protein. Eicosanoids were determined by EIA as described above.

The data illustrating the inhibition of prostaglandin biosynthesis *in vivo* by the compounds of this invention is shown in Table 3. Values reported are percent inhibition at 10 milligrams per kilogram body weight.

Carrageenan induced air pouch prostaglandin biosynthesis model (CAP)

5 Air pouches are formed in the backs of male Sprague Dawley rats by injecting 20 mL of sterile air on day 0. Three days later the pouch was reinflated with an additional 10 mL of sterile air. On day 7, 1 mL of saline containing 0.2 % lambda carrageenan (Sigma Chemical Co.) is injected into the pouch to induce the inflammatory reaction that is characterized by the release of prostaglandins. Test compounds are dosed at 0.1 to 10
10 mg/kg 30 minutes prior to carrageenan. Four hours after the carrageenan injection the pouch is lavaged and levels of prostaglandins are determined by enzyme immuno-assay using commercially available kits. Percent inhibitions are calculated by comparing the response in animals which have received vehicle to those which received compound. Values for Cox-2 inhibition that are parenthetical indicate ED₅₀ values.

15 The data illustrating the inhibition of prostaglandin biosynthesis *in vivo* by the compounds of this invention is shown in Table 3. Values reported are percent inhibition at 10 milligrams per kilogram body weight for CIP and CPE tests and at 3 milligrams per kilogram body weight for CAP testing.
